

## Method for manufacture of sertindole

### Field of the invention

The present invention relates to a new method of manufacturing the compound  
5 1-[2-[4-[5-chloro-1-(4-fluorophenyl)-1-*H*-indol-3-yl]-1-piperidinyl]ethyl]-2-imidazolidinone  
having the INN name sertindole and a new method of manufacturing the intermediate, 5-  
chloro-1-(4-fluorophenyl)-indole used in the method.

### Background of the invention

10 Sertindole is a well-known antipsychotic drug having the formula

The compound was disclosed in US patent No 4,710,500 and the antipsychotic activity  
thereof was described in US patent No 5,112,838. Sertindole is a potent centrally acting 5-  
HT<sub>2</sub> receptor antagonist in vivo and has further been disclosed to be active in models  
15 indicative of effects in the treatment of anxiety, hypertension, drug abuse and cognitive  
disorders.

A number of syntheses of sertindole have been disclosed in US patent No 4,710,500  
and WO 98/51685. 5-chloro-1-(4-fluorophenyl)-indole is a key intermediate in these  
syntheses. The syntheses of 5-chloro-1-(4-fluorophenyl)-indole as disclosed in US patent No  
20 4,710,500 and WO 98/51685 require multiple steps from commercially available starting  
materials, are expensive, occupy production equipment for prolonged periods resulting in low  
production capacity and result in environmental impact and safety. The synthesis which has  
been favoured so far for industrial synthesis of sertindole comprises the multiple step  
synthesis of 5-chloro-1-(4-fluorophenyl)-indole as disclosed in WO 98/51685.

25 An alternative synthetic strategy for 1-aryl-indoles is the Ullmann arylation of N-  
unsubstituted indoles with aryl halides catalyzed by large amounts of copper, typically near-  
stoichiometric amounts or more, as disclosed in e.g. *J. Med. Chem.* 1992, 35 (6), 1092-1101.  
The Ullmann arylation has, however, hitherto been disfavoured with regards to the synthesis  
of 5-chloro-1-(4-fluorophenyl)-indole due to various problems which to those skilled in the  
30 art are known to apply to the Ullmann arylation in general as the reactions typically result in

moderate yields, around 50%, correspondingly large amounts of coloured by-products and cumbersome work-up procedures caused by the complexation of the reaction product with the copper catalyst. These complexes often require surprisingly harsh treatment to liberate the free reaction product, as known to those skilled in the art.

Hence, there is a desire for new methods for manufacturing of 5-chloro-1-(4-fluorophenyl)-indole. Such new methods may be advantageous in that they are more cost effective, require fewer reaction steps, have reduced impact on the environment, give higher yields, result in increased production capacity, purer crude product and easier work-up procedures.

Recently, Klapars et al. *J.Am. Chem.Soc.* **2001**, *123*, 7727-7729, disclosed a variant of the Ullmann arylation wherein copper is present in catalytic amounts together with the chelating ligand trans-1,2-cyclohexanediamine.

### Summary of the invention

It has now surprisingly been found that it is possible to manufacture 5-chloro-1-(4-fluorophenyl)-indole in an efficient way giving good yields by arylation of 5-chloro-indole with a 4-fluorophenylhalide in the presence of catalytic amounts of a copper salt and a chelating ligand. This reaction is surprisingly selective. Illustrative of this high selectivity is the fact that there is virtually no by-products formed by reaction between the 5-chloro group of one molecule of 5-chloro-indole and the nitrogen of another molecule of 5-chloro-indole. This type of side reaction would be expected from the disclosure in *J.Am. Chem.Soc.* **2001**, *123*, 7727-7729, which illustrate the reactivity of arylchlorides in this type of reactions. It has even more surprisingly been found that the chelating ligand may be as simple as ethylenediamine. This reaction gives 5-chloro-1-(4-fluorophenyl)-indole in high yields and purity in a cost-effective single-step synthesis from commercially available starting materials.

Hence, the present invention relates to a novel method for manufacture of sertindole comprising manufacturing 5-chloro-1-(4-fluorophenyl)-indole and converting it to sertindole wherein the method for manufacture of 5-chloro-1-(4-fluorophenyl)-indole comprises reacting 5-chloro-indole with a 4-fluorophenylhalide in the presence of a base, a chelating ligand and catalytic amounts of a copper salt comprising copper(I) or copper(II) and an anion which does not interfere in an unfavourable way with the reaction.

Furthermore, the present invention relates to a method for manufacture of 5-chloro-1-(4-fluorophenyl)-indole comprising reacting 5-chloro-indole with a 4-fluorophenylhalide in the presence of a base, a chelating ligand and catalytic amounts of a copper salt comprising copper(I) or copper(II) and an anion which does not interfere in an unfavourable way with the reaction.

## Detailed description of the invention

As used throughout the description and the claims, the following definitions apply:

The term '4-fluorophenylhalide' means any compound selected from the group consisting of 4-fluoro-chlorobenzene, 4-fluoro-bromobenzene and 4-fluoro-iodobenzene.

5 The term 'catalytic amounts' means amounts that are significantly lower than stoichiometric amounts such as less than 20 mol % relative to 5-chloro-indole.

The term 'chelating ligand' means any compound comprising at least two atoms that are able to simultaneously coordinate to the same metal atom.

10 The term 'C<sub>1-6</sub>-alkyl' refers to a branched or unbranched alkyl group having from one to six carbon atoms inclusive, such as methyl, ethyl, 1-propyl, 2-propyl, 1-butyl, 2-butyl, 2-methyl-2-propyl, and 2-methyl-1-propyl.

The term 'C<sub>1-6</sub>-alkyl carboxylic acid' refers to C<sub>1-6</sub>-alkyl groups which are terminated by a carboxylic acid.

15 The term 'aryl' refers to a carbocyclic aromatic group, such as phenyl or naphthyl, in particular phenyl.

In one aspect the present invention relates to a method for manufacture of sertindole comprising manufacturing 5-chloro-1-(4-fluorophenyl)-indole and converting it to sertindole wherein the method for manufacture of 5-chloro-1-(4-fluorophenyl)-indole comprises reacting 5-chloro-indole with a 4-fluorophenylhalide in the presence of a base, a chelating  
20 ligand and catalytic amounts of a copper salt comprising copper(I) or copper(II) and an anion which does not interfere in an unfavourable way with the reaction.

In a further aspect, the present invention relates to a method for manufacture of 5-chloro-1-(4-fluorophenyl)-indole comprising reacting 5-chloro-indole with a 4-fluorophenylhalide in the presence of a base, a chelating ligand and catalytic amounts of a  
25 copper salt comprising copper(I) or copper(II) and an anion which does not interfere in an unfavourable way with the reaction.

The embodiments described hereafter applies to all aspects of the invention.

In one embodiment of the invention, the chelating ligand is a substituted or unsubstituted 1,10-phenanthroline, such as an unsubstituted 1,10-phenanthroline. In another  
30 embodiment the chelating ligand is a compound of the formula  $X-(CR^1R^2-(CR^5R^6)_n-CR^3R^4-Y)_m$ , wherein X and Y independently are selected from  $NR^7R^8$  and  $OR^9$ ,  $R^1-R^9$  independently are selected from hydrogen, C<sub>1-6</sub>-alkyl, C<sub>1-6</sub>-alkyl carboxylic acid and aryl or one of  $R^1$  and  $R^2$  together with one of  $R^5$  and  $R^6$  are C<sub>3-6</sub>-alkylene, m is 1 or 2, and n is 0, 1, 2 or 3. In a preferred embodiment, at least one of X and Y is  $NR^7R^8$ , and more preferred both of X and Y  
35 are  $NR^7R^8$ . In another preferred embodiment,  $R^7$  and  $R^8$  are independently selected from hydrogen, C<sub>1-6</sub>-alkyl and C<sub>1-6</sub>-alkyl carboxylic acid, and more preferred  $R^7$  and  $R^8$  are

hydrogen. In yet another preferred embodiment, R<sup>5</sup> and R<sup>6</sup> are hydrogen. In yet another preferred embodiment, m is 1. In yet another preferred embodiment, n is 0. In yet another preferred embodiment R<sup>1</sup>-R<sup>4</sup> are hydrogen, or R<sup>1</sup> and R<sup>3</sup> together are C<sub>3-6</sub>-alkylene and R<sup>2</sup> and R<sup>4</sup> are hydrogen. Preferred chelating ligands are those selected from the group comprising  
5 1,2-cyclohexanediamine, N,N,N,N-tetramethyl ethylenediamine, N,N-diethyl ethylenediamine, ethylenediamine, ethylenediamine N,N,N,N-tetraacetic acid (EDTA), diethylenetriamine N,N,N,N,N-pentaacetic acid (DTPA) and substituted or unsubstituted 1,10-phenantroline; more preferred chelating ligands are those selected from the group comprising 1,2-cyclohexanediamine, N,N,N,N-tetramethyl ethylenediamine, N,N-diethyl  
10 ethylenediamine and ethylenediamine, and the most preferred chelating ligand is ethylenediamine.

In a preferred embodiment of the invention, the 4-fluorophenylhalide is 4-fluorobromobenzene or 4-fluoro-iodobenzene as the reactivity of the 4-fluorophenylhalides increases in the order chloro-<bromo-<iodo for this type of reactions. In a preferred  
15 embodiment of the invention the 4-fluorophenylhalide is added in a molar surplus relative to 5-chloro-indole. Preferably the molar ratio 4-fluorophenylhalide:5-chloro-indole is in the range from about 1.1 to about 3, more preferred from about 1.2 to about 2.5, and most preferred from about 1.3 to about 2.0.

The methods of manufacture according to the present invention are advantageous as  
20 compared to classical Ullmann arylation as they only require catalytic amounts of a copper salt, i.e. less than 20 mol % relative to 5-chloro-indole. Preferably the amount of copper salt is less than 10 mol % relative to 5-chloro-indole and even more preferred in the range from about 1 to about 5 mol %. The products made according to the present invention may be isolated without the harsh treatment, such as boiling in hydrochloric acid or treatment with  
25 cyanides, which often is necessary in order to break the complexes between copper and the product of the classical Ullmann reactions.

Any copper salt comprising copper(I) or copper (II) and an anion which does not interfere in an unfavourable way with the reaction may be applied. Exemplary of anions, which may interfere in an unfavourable way with the reaction, are cyanide, sulphide and  
30 selenide. Cyanide may react as a nucleophile and compete with the indole for reaction with the 4-fluorophenylhalide, whereas sulphide and selenide may inactivate the copper catalyst. Those skilled in the art will be aware that other anions also may interfere in an unfavourable way with the reaction and easily realise if an anion interferes in an unfavourable way with the reaction. Preferred copper salts for use in the present invention are selected from the group  
35 comprising CuCl, CuBr, CuI, CuCl<sub>2</sub>, CuBr<sub>2</sub>, CuI<sub>2</sub>, CuOCOCH<sub>3</sub>, Cu(OCOCH<sub>3</sub>)<sub>2</sub>, anhydrous or hydrated CuSO<sub>4</sub>, CuCO<sub>3</sub>, Cu<sub>2</sub>O and mixtures of said copper salts; more preferred copper salts

are those selected from the group comprising CuCl, CuBr, CuI, CuCl<sub>2</sub>, CuBr<sub>2</sub> and CuI<sub>2</sub>. These work well as catalysts in the reaction and are readily available to reasonable prices. The copper salt may be added in one portion at the start of the reaction or in two or more portions distributed over the reaction time.

5 Various bases may be employed in the methods of manufacture of the present invention. Exemplary bases are the carbonates, hydrogen carbonates, phosphates, hydrogen phosphates, dihydrogen phosphates, oxides and hydroxides of alkali metals. Preferred bases are potassium and sodium carbonates as these are readily available to a low price and easy to handle. The base is typically present in a molar excess relative to 5-chloro-indole, preferably  
10 the amount of base is in the range from about 1.05 molar equivalents to about 2.5 molar equivalents.

The methods of manufacture of the present invention may be performed by heating a neat mixture of the reactants without any solvent or in a suitable solvent system. Exemplary  
15 of such solvent systems are toluene, mixtures of toluene and water, ethers such as dioxane, tetrahydrofuran (THF), diethyl ether, dimethyl ether, monoethylene glycol dimethyl ether (monoglyme) and diethylene glycol dimethyl ether (diglyme), amides such as dimethylformamide (DMF), dimethylacetamide (DMA), N-methyl-pyrrolidone (NMP). Preferred solvents are DMF and toluene and most preferred is DMF.

Typically the methods of manufacture of the present invention are performed at  
20 temperatures above 80 °C, preferably in the range from 90 °C to 200 °C, more preferred in the range from 100 °C to 160 °C. Higher yields may be obtained by pretreating the reaction system at a temperature in the range from about 30 °C to about 70 °C, preferably in the range from about 40 °C to about 60 °C, for a period of time ranging from about 0.5 hour to about 20 hours, preferably in the range from about 1 hour to about 15 hours, before completing the  
25 reaction at a higher temperature as specified above. Evidently, if the solvent system used is incompatible with the reaction temperature, such as temperatures above 80 °C, then the method may be carried out under pressure.

### Examples

30 The following examples is meant to illustrate various embodiments of the invention and should not be read as limiting the scope of protection.

### Chromatographic procedures

35 HPLC and GC analyses were performed according to the procedures described below.

*Analytical Method HPLC - 5-Chloroindole*

## Internal Standard Solution

Dilute about 2 ml of Undecane (GC Standards) with Acetone in a 250 mL volumetric flask.

## Sample Preparation

10

Weigh accurately about 250 mg of sample (5-chloroindole or 5-chloro-1-(4-fluorophenyl)-indole) in a 25 mL volumetric flask and add Internal Standard Solution to volume. Final concentration 25 mg/mL.

### Standard Preparation

Weigh accurately about 250 mg of Reference Standard (5-chloroindole or 5-chloro-1-(4-fluorophenyl)-indole) in a 25 mL volumetric flask and add Internal Standard Solution to volume. Final concentration 25 mg/mL.

5

### Analytical Procedure

Inject the Standard three times (at least), integrate the obtained chromatograms and calculate the ratio between Area of analyte and Area of Internal Standard. If the ratio Standard Deviation % is less than 1.0% inject the Sample and integrate the chromatogram and calculate the ratio as described above. Calculate the product assay with the formula:

10

$$\text{Assay\%} = (\text{Sample Area Ratio} \times \text{Conc. Std} \times 100) / (\text{Standard Area Ratio} \times \text{Sample Conc.})$$

Where:

15

Sample Area Ratio = Area Ratio obtained by sample injection

Standard Area Ratio = Average of area ratios obtained by Standard injection

Sample Conc. = Concentration (mg/ml) of Sample

Standard Conc. = Concentration (mg/ml) of Standard

20

*Analytical Method GC - 5-chloro-1-(4-fluorophenyl)-indole - Conversion In-Process-Control*

Instrument configuration as above.

25

### Conversion In-Process-Control

#### Sample Preparation

Stop the stirring and sample 0.1 mL of reaction solution. Dilute with 5 ml of toluene. Filter the solution obtained and inject.

30

Calculate the conversion with the formula:

$$\text{Conversion\%} = (5\text{-chloro-1-(4-fluorophenyl)-indole Area} \times 100) / (5\text{-Chloroindole Area} + 5\text{-chloro-1-(4-fluorophenyl)-indole Area})$$

35

Where:

5-chloro-1-(4-fluorophenyl)-indole Area = Area detected for 5-chloro-1-(4-fluorophenyl)-indole

5 5-Chloroindole Area = Area detected for 5-Chloroindole

#### Identification of product

NMR spectra were determined on a Bruker Avance 300 spectrometer

10  $^1\text{H-NMR}$   $\text{CDCl}_3$  300MHz ( $\delta$  ppm,  $J$  Hz): 7.70 (1H, d,  $J = 2.0$ ); 7.49-7.39 (3H, m); 7.32 (1H, d,  $J = 3.2$ ); 7.30-7.17 (3H, m); 6.66 (1H, d,  $J = 3.2$ ).

$^{13}\text{C-NMR}$   $\text{CDCl}_3$  75MHz ( $\delta$  ppm,  $J_{\text{C,F}}$  Hz): 161.68 (d,  $J_{\text{C,F}} = 245.0$ ); 135.87 (d,  $J_{\text{C,F}} = 2.0$ ); 134.96; 130.62; 129.75; 126.59 (d,  $J_{\text{C,F}} = 8.3$ ); 126.49; 123.18; 120.97; 117.04  
15 (d,  $J_{\text{C,F}} = 22.0$ ); 111.71; 103.59.

$^{19}\text{F-NMR}$   $\text{CDCl}_3$  282MHz ( $\delta$  ppm): 114.94 (m).

These data are in agreement with the structure of 5-chloro-1-(4-fluorophenyl)-indole.

20

#### Synthetic examples with toluene as solvent

##### *Example 1: N,N,N,N-tetramethyl ethylenediamine as ligand*

A jacketed glass reactor was charged with 40 g of crude 5-chloro-indole (80% pure as determined by HPLC) (32 g, 0.211 mol),  $\text{K}_2\text{CO}_3$  (40.2 g, 0.2902 mol), 4-fluorobromobenzene (92.3 g, 0.5277 mol),  $\text{CuI}$  (2.5 g,  $1.32 \cdot 10^{-2}$  mol), N,N,N,N-tetramethyl ethylenediamine (3.2 g,  $5.28 \cdot 10^{-2}$  mol) and 80 mL of toluene. The mixture was heated to reflux (about 115 °C), under vigorous stirring, and maintained for 40 hours.

After cooling to 60 °C, 80 mL of Toluene and 80 mL of water were added and the mixture was maintained under stirring at 50 °C for ½ hour and the organic layer was separated and treated with 80 mL of water. The residual carbonates were then dissolved by slow addition of aqueous HCl 32% until solution reached pH = 2-3. The mixture was maintained under stirring at 50 °C for ½ hour the aqueous layers were eliminated. The organic layer was then concentrated, by solvent distillation at reduced pressure, and the crude product was obtained as an oil (47.2 g). The yield, based on HPLC (assay against ext. Std.), was about  
35 42%.

*Example 2: N,N-diethyl ethylenediamine as ligand*

Following the procedure of example 1 except that N,N-diethyl ethylenediamine was used in stead of N,N,N,N-tetramethyl ethylenediamine the crude product was obtained as an oil (84 g). The yield, based on HPLC (assay against ext. Std.), was about 50%.

5

*Example 3: Trans-1,2-cyclohexanediamine as ligand*

A jacketed glass reactor was charged with 10 g of crude 5-chloro-indole (80% pure as determined by HPLC) (8 g,  $5.2 \cdot 10^{-2}$  mol),  $K_2CO_3$  (12.7 g,  $9.2 \cdot 10^{-2}$  mol), 4-fluoro-bromobenzene (12.7 g,  $7.3 \cdot 10^{-2}$  mol), CuI (1.26 g,  $6.6 \cdot 10^{-3}$  mol), *trans*-  
10 1,2-cyclohexanediamine (1.13 g,  $9.9 \cdot 10^{-3}$  mol) and 20 mL of toluene. The mixture was heated to reflux (about 115 °C), under vigorous stirring, and maintained for 12 hours.  
The conversion checked by GC was about 79%.

After cooling to 60 °C, the solid residual were filtered off and the organic solution was then concentrated, by solvent distillation at reduced pressure, and the crude product was  
15 obtained as an oil (15.4 g)

*Example 4:  $K_3PO_4$  as base*

A jacketed glass reactor was charged with 20 g of crude 5-chloro-indole (80% pure as determined by HPLC) (16 g, 0.106 mol),  $K_3PO_4$  (18.6 g, 0.088 mol), 4-fluoro-bromobenzene  
20 (46.2 g, 0.263 mol), CuI (1.25 g,  $1.32 \cdot 10^{-2}$  mol), ethylenediamine (1.58 g,  $2.62 \cdot 10^{-2}$  mol) and 40 mL of toluene. The mixture was heated to reflux (about 115 °C), under vigorous stirring, and maintained for 22 hours. An additional amount of  $K_3PO_4$  (9.3 g,  $4.4 \cdot 10^{-2}$  mol) was added and the mixture was stirred for 19h. The conversion checked by GC was about 42%.

After cooling to 60 °C, 80 mL of Toluene and 80 mL of water were added and the  
25 mixture was maintained under stirring at 50 °C for ½ hour and the organic layer were separated and treated with 80 mL of water. The residual phosphates were then dissolved by slow addition of aqueous HCl 32% until solution reached pH = 2-3. The mixture was maintained under stirring at 50 °C for ½ hour the aqueous layers were eliminated. The organic layer was then concentrated, by solvent distillation at reduced pressure, and the crude product  
30 was obtained as an oil (62.3 g).

*Example 5: CuBr as catalyst source*

A jacketed glass reactor was charged with 40 g of crude 5-chloro-indole (80% pure as determined by HPLC) (32 g, 0.211 mol),  $K_2CO_3$  (40.2 g, 0.2902 mol), 4-fluoro-  
35 bromobenzene (92.3 g, 0.5277 mol), CuBr (1.89 g,  $1.32 \cdot 10^{-2}$  mol), ethylenediamine (3.2 g,

5.28·10<sup>-2</sup> mol) and 80 ml of toluene. The mixture was heated to reflux (about 115 °C), under vigorous stirring, and maintained for 32 hours. The conversion checked by GC was about 92%.

After cooling to 60 °C, 80 mL of toluene and 80 mL of water were added and the mixture was maintained under stirring at 50 °C for ½ hour and the organic layer was separated and treated with 80 mL of water. The residual carbonates were then dissolved by slow addition of aqueous HCl 32% until solution reached pH = 2-3. The mixture was maintained under stirring at 50 °C for ½ hour the aqueous layers were eliminated. The organic layer was then concentrated, by solvent distillation at reduced pressure, and the crude product was obtained as an oil (64.4 g).

#### *Example 6: CuCl as catalyst source*

A jacketed glass reactor was charged with 40 g of crude 5-chloro-indole (80% pure as determined by HPLC) (32 g, 0.211 mol), K<sub>2</sub>CO<sub>3</sub> (40.2 g, 0.2902 mol), 4-fluoro-bromobenzene (92.3 g, 0.5277 mol), CuCl (1.31 g, 1.32·10<sup>-2</sup> mol), ethylenediamine (3.2 g, 5.28·10<sup>-2</sup> mol, 25%) and 80 mL of toluene. The mixture was heated to reflux (about 115 °C), under vigorous stirring, and maintained for 32 hours. The conversion checked by GC was about 92%.

After cooling to 60 °C, 80 mL of toluene and 80 mL of water were added and the mixture was maintained under stirring at 50 °C for ½ hour and the organic layer was separated and treated with 80 mL of water. The residual carbonates were then dissolved by slow addition of aqueous HCl 32% until solution reached pH = 2-3. The mixture was maintained under stirring at 50°C for ½ hour the aqueous layers were eliminated. The organic layer was then concentrated, by solvent distillation at reduced pressure, and the crude product was obtained as an oil (7.81g).

#### *Example 7: CuBr<sub>2</sub> as catalyst source*

A glass jacketed reactor was charged with 20 g of crude 5-chloro-indole (80% pure as determined by HPLC) (16 g, 0.106 mol), K<sub>2</sub>CO<sub>3</sub> (20 g, 0.144 mol), 4-fluoro-bromobenzene (46.1 g, 0.26 mol), CuBr<sub>2</sub> (1.46 g, 6.6·10<sup>-3</sup> mol), ethylenediamine (1.58 g, 2.6·10<sup>-2</sup> mol) and 40 ml of toluene. The mixture was heated to reflux (about 115 °C), under vigorous stirring, and maintained for 28 hours. The conversion checked by GC was about 44% (after 20 hours the conversion checked by GC was about 43%).

After cooling to 60 °C, 50 mL of Toluene and 40 mL of water were added and the mixture was cooled to 50 °C under stirring. The residual carbonate were then dissolved by slow addition of aqueous HCl 32% until solution reached pH = 2-3. The mixture was

maintained under stirring at 50 °C for ½ hour before the organic layer was separated. The organic layer was treated several times with saturated solution of Sodium Chloride and water under stirring at 50 °C and concentrated, by solvent distillation at reduced pressure. The crude product was obtained as an oil (41 g)

Examples 8-18 illustrate variations of the CuI-Ethylenediamine-K<sub>2</sub>CO<sub>3</sub>-toluene system. They were performed according to the procedure of example 1 except for the details specified. The amounts are given relative to the amount of 5-chloro-indole (calculated as pure 5-chloro-indole). % means mol %, equivalent means molar equivalent, and volume means ml of solvent per g of 5-chloro-indole.

*Example 8:*

10% of CuI, 15% of ethylenediamine, 2.1 equivalent of K<sub>2</sub>CO<sub>3</sub>, 1.1 equivalent of 4-fluoro-bromobenzene, 2 volumes of toluene, 16h reflux. The conversion checked by GC was about 99.5%.

*Example 9:*

1% of CuI, 5% of ethylenediamine, 1.5 equivalent of K<sub>2</sub>CO<sub>3</sub>, 1.1 equivalent of 4-fluoro-bromobenzene, 2 volumes of toluene, 10h reflux. The conversion checked by GC was about 52%.

*Example 10:*

1% of CuI, 5% of ethylenediamine, 1.5 equivalent of K<sub>2</sub>CO<sub>3</sub>, 1.3 equivalent of 4-fluoro-bromobenzene, 2 volumes of toluene, 10h reflux. The conversion checked by GC was about 45%.

*Example 11:*

5% of CuI, 15% of ethylenediamine, 1.05 equivalent of K<sub>2</sub>CO<sub>3</sub>, 1.2 equivalent of 4-fluoro-bromobenzene, 2 volumes of toluene, 18h distilling off water as azeotrope and recycling toluene. The conversion checked by GC was about 55%.

*Example 12:*

5% of CuI, 15% of ethylenediamine, 2.1 equivalent of K<sub>2</sub>CO<sub>3</sub>, 1.1 equivalent of 4-fluoro-bromobenzene, 2 volumes of toluene, 36h reflux. The conversion checked by GC was about 96%.

*Example 13:*

5% of CuI, 15% of ethylenediamine, 1.5 equivalent of  $K_2CO_3$ , 1.1 equivalent of 4-fluoro-bromobenzene, 2 volumes of toluene, 36h reflux. The conversion checked by GC was about 95%.

*Example 14:*

5% of CuI, 20% of ethylenediamine, 1.1 equivalent of  $K_2CO_3$ , 1.1 equivalent of 4-fluoro-bromobenzene, 2 volumes of Toluene, 44h reflux. The conversion checked by GC was about 99%.

*Example 15:*

5% of CuI, 20% of ethylenediamine, 1.1 equivalent of  $K_2CO_3$ , 2 equivalent of 4-fluoro-bromobenzene, 2 volumes of toluene, 36h reflux. Addition of CuI in two portions (2x2.5%, 2<sup>nd</sup> after 10 h refluxing). The conversion checked by GC was about 98%.

*Example 16:*

5% of CuI, 1.14 equivalent of ethylenediamine, 1.1 equivalent of  $K_2CO_3$ , 2 equivalent of 4-fluoro-bromobenzene, 2 volumes of toluene, 24h reflux. The conversion checked by GC was about 86%.

*Example 17:*

2.5% of CuI, 40% of ethylenediamine, 1.1 equivalent of  $K_2CO_3$ , 2 equivalent of 4-fluoro-bromobenzene, 2 volumes of toluene, 26h reflux. The conversion checked by GC was about 87%.

*Example 18: Under moderate pressure*

5% of CuI, 20% of ethylenediamine, 1.1 equivalent of  $K_2CO_3$ , 2 equivalent of 4-fluoro-bromobenzene, 2 volumes of toluene. The reaction mixture was heated to 120 °C in a closed reactor for 44 h allowing the pressure to increase to a maximum of 2 bar. The conversion checked by GC was about 87%.

Toluene and water as solvent system*Example 19:  $K_3PO_4$  as base*

A jacketed glass reactor was charged with 40 g of crude 5-chloro-indole (80% pure as determined by HPLC) (32 g, 0.211 mol),  $K_3PO_4$  (56 g, 0.264 mol), 4-fluoro-bromobenzene

(92.3 g, 0.5277 mol), CuI (2.5 g,  $1.32 \cdot 10^{-2}$  mol), ethylenediamine (3.2 g,  $5.28 \cdot 10^{-2}$  mol), 80 mL of toluene and 20 ml of water. The mixture was heated to reflux (about 115 °C), under vigorous stirring, and maintained for 40 hours. The conversion checked by GC was about 89%.

5 After cooling to 60 °C, 80 mL of Toluene and 80 mL of water were added and the mixture was maintained under stirring at 50 °C for ½ hour and the organic layer was separated and treated with 80 mL of water. The residual phosphates were then dissolved by slow addition of aqueous HCl 32% until solution reached pH = 2-3. The mixture was maintained under stirring at 50 °C for ½ hour the aqueous layers were eliminated. The organic  
10 layer was then concentrated, by solvent distillation at reduced pressure, and the crude product was obtained as an oil (86.4 g).

*Example 20: K<sub>2</sub>CO<sub>3</sub> as base*

A jacketed glass reactor was charged with 40 g of crude 5-chloro-indole (80% pure as determined by HPLC) (32 g, 0.211 mol), K<sub>2</sub>CO<sub>3</sub> (40.2 g, 0.290 mol), 4-fluoro-bromobenzene  
15 (92.3 g, 0.5277 mol), CuI (2.5 g,  $1.32 \cdot 10^{-2}$  mol), ethylenediamine (3.2 g,  $5.28 \cdot 10^{-2}$  mol), 80 ml of toluene and 20 mL of water. The mixture was heated to reflux (about 110 °C), under vigorous stirring, and maintained for 36 hours. The conversion checked by GC was about 67%.

20 After cooling to 60 °C, 80 mL of toluene and 80 mL of water were added and the mixture was maintained under stirring at 50 °C for ½ hour and the organic layer were separated and treated with 80 mL of water. The residual carbonates were then dissolved by slow addition of aqueous HCl 32% until solution reached pH = 2-3. The mixture was maintained under stirring at 50 °C for ½ hour the aqueous layers were eliminated. The organic  
25 layer was then concentrated, by solvent distillation at reduced pressure, and the crude product was obtained as an oil (68 g). The yield, based on HPLC (assay against ext. Std.), was about 50%.

Dimethylformamide (DMF) as a solvent

30 *Example 21:*

A glass jacketed reactor was charged, under nitrogen, with distilled 5-chloro-indole (94% pure as determined by HPLC) (200 g, 1.32 mol), K<sub>2</sub>CO<sub>3</sub> (200 g, 1.45 mol), 4-fluoro-bromobenzene (461 g, 2.63 mol), CuI (12.6 g, 0.066 mol), ethylenediamine (15.9 g, 0.26 mol) and 400 mL of dimethylformamide. The mixture was heated to 40°C under vigorous stirring  
35 and kept at that temperature for 12 hours whereafter the mixture was to reflux (about 130-

135°C), under vigorous stirring, by increasing the jacket temperature over period of 45 minutes to 145 °C and maintained at reflux for 5 hours.

After cooling to 60 °C, 400 mL of toluene and 400 mL of water were added and the mixture was cooled to 50 °C under stirring. The organic phase was separated and washed, at 50 °C with diluted hydrochloric acid (5 ml HCl 32% + 100 ml H<sub>2</sub>O) and finally with a solution of diluted ammonia (5 mL of NH<sub>3</sub> 33% + 200 mL of H<sub>2</sub>O). The solvent was then removed by distillation at reduced pressure and the crude product was obtained as an oil (469 g). The yield, based on HPLC (assay against ext. Std.), was about 94%.

#### 10 *Example 22: CuBr as catalyst source*

A glass jacketed reactor was charged with 20 g of crude 5-chloro-indole (80% pure as determined by HPLC) (16 g, 0.106 mol), K<sub>2</sub>CO<sub>3</sub> (20 g, 0.144 mol), 4-fluoro-bromobenzene (47.7 g, 0.27 mol), CuBr (0.95 g, 6.6\*10<sup>-3</sup> mol), ethylenediamine (1.58 g, 2.6\*10<sup>-2</sup> mol) and 40 mL of dimethylformamide. The mixture was heated to reflux (about 130-135 °C), under vigorous stirring, and maintained for 20 hours. The conversion checked by GC was about 99.5% (after 6 hours the conversion checked by GC was about 81%).

After cooling to 60 °C, 80 mL of Toluene and 40 mL of water were added and the mixture was cooled to 50 °C under stirring. The residual carbonate were then dissolved by slow addition of aqueous HCl 32% until solution reached pH = 2-3. The mixture was maintained under stirring at 50 °C for ½ hour. The organic layer was separated and treated with 40 mL of water. The mixture was maintained under stirring at 50 °C for ½ hour the aqueous layers were eliminated. The organic layer was treated several times with saturated solution of ammonium sulphate and water under stirring at 50 °C and then concentrated by solvent distillation at reduced pressure. The crude product was obtained as an oil (38.4 g). The yield, based on HPLC (assay against ext. Std.), was about 80%.

#### *Example 23: CuCl and KI as catalyst source*

A glass jacketed reactor was charged with 20 g of crude 5-chloro-indole (80% pure as determined by HPLC) (16 g, 0.106 mol), K<sub>2</sub>CO<sub>3</sub> (20 g, 0.144 mol), 4-fluoro-bromobenzene (47.7 g, 0.27 mol), CuCl (0.595 g, 6.0\*10<sup>-3</sup> mol), ethylenediamine (1.58 g, 2.6\*10<sup>-2</sup> mol) and 40 mL of dimethylformamide. The mixture was heated to reflux (about 130-135 °C), under vigorous stirring. After 4 hours was added KI (1.16 g, 6.99\*10<sup>-3</sup> mol). The mixture was then maintained at reflux for 16 h. The conversion checked by GC was about 99.5% (after 6 hours the conversion checked by GC was about 53%).

After cooling to 60 °C, 80 mL of Toluene and 40 mL of water were added and the mixture was cooled to 50 °C under stirring. The residual carbonates were then dissolved by

slow addition of aqueous HCl 32% until solution reached pH = 2-3. The mixture was maintained under stirring at 50 °C for ½ hour the organic layer were separated and treated with 40 mL of water. The mixture was maintained under stirring at 50 °C for ½ hour the aqueous layers were eliminated. The organic layer was treated several times with saturated solution of ammonium sulfate and water under stirring at 50 °C then and concentrated, by solvent distillation at reduced pressure. The crude product was obtained as an oil (37.5 g). The yield, based on HPLC (assay against ext. Std.), was about 82%.

Examples 24-29 illustrate variations of the CuI-Ethylenediamine-K<sub>2</sub>CO<sub>3</sub>-Dimethylformamide system. They were performed according to the procedure of example 21 except for the scale which was 40 g of 5-chloro-indole and the details specified. The amounts are given relative to the amount of 5-chloro-indole (calculated as pure 5-chloro-indole). % means mol %, equivalent means molar equivalent, and volume means ml of solvent per g of 5-chloro-indole.

#### Example 24

5% of CuI, 20% of ethylenediamine, 1.1 mol of K<sub>2</sub>CO<sub>3</sub>, 2 mol of 4-fluorobromobenzene, 2 volumes of dimethylformamide, 29h 120°C. The conversion checked by GC was about 80%.

#### Example 25

5% of CuI, 20% of ethylenediamine, 1.1 mol of K<sub>2</sub>CO<sub>3</sub>, 2 mol of 4-fluorobromobenzene, 2 volumes of dimethylformamide, 6h 135°C. The conversion checked by GC was about 99%.

#### Example 26

5% of CuI, 20% of ethylenediamine, 1.1 mol of K<sub>2</sub>CO<sub>3</sub>, 1.2 mol of 4-fluorobromobenzene, 2 volumes of dimethylformamide. Pretreatment of catalytic system 1 h at 50°C. Reaction 5.5h 135°C. The conversion checked by GC was about 94%.

#### Example 27

5% of CuI, 20% of ethylenediamine, 1.1 mol of K<sub>2</sub>CO<sub>3</sub>, 2 mol of 4-fluorobromobenzene, 2 volumes of dimethylformamide and 0.5 volumes of water. Pretreatment of catalytic system 1 h at 50 °C. Reaction 19h 118 °C (reflux). The conversion checked by GC was about 58%.

*Example 28*

5% of CuI, 20% of ethylenediamine, 1.1 mol of K<sub>2</sub>CO<sub>3</sub>, 2 mol of 4-fluorobromobenzene, 2 volumes of Dimethylformamide. Pretreatment of catalytic system 14 h at 50 °C. Reaction 7h 135 °C. The conversion checked by GC was about 92.2%.

*Example 29*

5% of CuI, 20% of ethylenediamine, 1.1 mol of K<sub>2</sub>CO<sub>3</sub>, 2 mol of 4-fluorobromobenzene, 2 volumes of dimethylformamide. NO Pretreatment of catalytic system 50 °C. Reaction 7h 135 °C. The conversion checked by GC was about 78%.

Example 30 illustrates the removal of the impurity 5-bromo-1-(4-fluorophenyl)-indole, which is generated in levels up to 1% by performing a halogen exchange during work-up. Lowering of the impurity by recrystallisation turned out to be difficult.

*Example 30*

A glass jacketed reactor was charged, under nitrogen, with 5-chloroindole (200 g, 1.32 mol), K<sub>2</sub>CO<sub>3</sub> (200 g, 1.45 mol), 4-bromo-fluorobenzene (347 g, 1.98 mol) and 400 ml of dimethylformamide. The mixture was heated to 50°C and ethylenediamine (16 g, 0.26 mol) and CuI (12.5 g, 0.066 mol) were charged in the reactor. The mixture was kept at that temperature for 1.5 hours, then was heated up to 130°C for 1 hour and finally was heated to reflux temperature (about 139°C) for 4 hours. The conversion checked by HPLC was >95%. When the coupling reaction was completed (ref. Example.doc), the mixture was cooled to 100°C and 800ml of toluene were added. After cooling to 60°C the mixture was washed with a solution of diluted ammonia (80 ml of NH<sub>3</sub> 30% + 400 ml of H<sub>2</sub>O). The organic phase was washed at 40°C with diluted hydrochloric acid (50 ml of HCl 32% + 200 ml of H<sub>2</sub>O) and finally with diluted ammonia (44 ml of NH<sub>3</sub> 30% + 300 ml of water). The organic solution was concentrated by distillation at normal pressure and then at reduced pressure by stripping with 1-methyl-2-pyrrolidinone (NMP). The residue was diluted with NMP. CuCl (17-35 g, 0.17-0.35 mol) and CuI (2.5g, 0.013 mol) were charged in the reactor and mixture was heated up to 140°C for 6 hours. After diluting with toluene (600 ml), the mixture was filtered and then washed with ammonia (45 ml of NH<sub>3</sub> 30% + 300 ml of H<sub>2</sub>O). The organic phase was concentrated by distillation at normal pressure, then was diluted with sulfolane and concentrated under vacuum. The crude was finally purified by thin film distillation.

### Dioxane as solvent

#### *Example 31: Trans-1,2-Cyclohexanediamine as ligand*

A jacketed glass reactor was charged with 5g of crude 5-chloro-indole (80% pure as determined by HPLC) (4 g,  $2.6 \cdot 10^{-2}$  mol),  $K_2CO_3$  (9.58 g,  $6.9 \cdot 10^{-2}$  mol), 4-fluorobromobenzene (6.34 g,  $3.6 \cdot 10^{-2}$  mol), CuI (0.063 g,  $6.6 \cdot 10^{-4}$  mol), *trans*-1,2-cyclohexanediamine (0.377 g,  $3.3 \cdot 10^{-3}$  mol) and 33 mL of dioxane. The mixture was heated to about 110 °C, under vigorous stirring, and maintained for 25 hours. The conversion checked by GC was about 45%.

After cooling to 60 °C, the solid residual were filtered off and the organic solution was then concentrated, by solvent distillation at reduced pressure, and the crude product was obtained as an oil (8.2 g).

### Neat - Without Solvent

#### *Example 32:*

A jacketed glass reactor was charged with 30 g of distilled 5-Cl-indole (96% pure as determined by HPLC) (28.8 g, 0.190 moles),  $K_2CO_3$  (30.1 g, 0.218 moles), 4-fluorobromobenzene (143.4 g, 0.819 moles), CuI (1.88 g,  $9.89 \cdot 10^{-3}$  moles) and ethylenediamine (2.38 g,  $3.96 \cdot 10^{-2}$  moles). The mixture was heated to 130-135 °C under vigorous stirring, and maintained for 5 hours.

After cooling to 50 °C, 80 mL of Toluene and 80 mL of water were added and the mixture was maintained under stirring at 50 °C for 15 minutes. The residual carbonates were then dissolved by slow addition of  $H_2SO_4$  36% until solution reached pH = 2-3 (about 40 mL). The mixture was maintained under stirring at 50 °C for ½ hour then cooled to room temperature and stirred overnight. The aqueous layer (upper phase) was eliminated. The organic phase was washed two times with water (2x50mL) and then concentrated, by solvent distillation at reduced pressure. The crude product was obtained as an oil (115.9 g). The yield, based on HPLC (assay against ext. Std.), was about 42%.
